Summary

This dataset depicts the boundaries of state refuges, critical habitat areas, and sanctuaries in Alaska and provides information to assist in inquiries including applying for a special areas permit to use these lands.

Description

The Alaska State Legislature has protected portions of Alaska's outstanding natural habitat and associated fish and wildlife resources by establishing State Refuges, State Sanctuaries, and State Critical Habitat Areas. The statutes which authorize these special areas give the Alaska Department of Fish and Game authority to preserve and protect the unique aspects for which they were established. The SALDAs_08 dataset depicts the boundaries of these areas. Legislation pertaining to these lands may be found in Alaska Statutes Title 16, Chapter 20. State Refuges are established to make sure wildlife continue to populate specific areas and to insure the public continues to have use of these wildlife resources. These areas have fairly sizeable concentrations, or many different types, of waterfowl, big game, shorebirds, or other species. One or more elements of habitat - such as food, vegetation, water - needed by this wildlife are present. The Alaska Department of Fish and Game manages state refuges by focusing on a featured wildlife species or group of species. This may mean rehabilitating or improving the habitat on which the wildlife depends. Uses of refuge lands are controlled to prevent habitat changes which would be harmful to the wildlife populations. Activities are also controlled to prevent displacement of animals from their natural habitat and interruption of seasonal activities (e.g. nesting). Human uses - including recreational pursuits and harvest of wildlife resources - are permitted so long as they are in keeping with the primary reason for establishing the refuge. State Critical Habitat Areas are places where protective emphasis is on the environment in which wildlife occurs. State critical habitat areas are set aside to protect

the land and resources necessary to support essential life functions or large concentrations of one or more fish and wildlife populations. Critical habitat areas may be complete biotic systems - identifiable environmental units that operate as self-sustaining systems - or well-defined areas specifically needed by fish or wildlife for certain functions such as nesting, spawning or over-wintering. Management by the Alaska Department of Fish and Game of critical habitat areas is aimed primarily at providing protection for the habitat. All uses of the land which are not compatible with that aim are restricted. In most instances, harvest of fish and wildlife is not precluded in a critical habitat area. State Game Sanctuaries are areas set aside to provide permanent protection for wildlife populations and their habitats, so that these resources may be preserved for scientific, aesthetic, and educational purposes, to manage human use and activities in a way that is compatible with the area, and to provide opportunities that are compatible for wildlife viewing, fisheries enhancements, and fishing, for temporary safe anchorage, and other activities. The wildlife in these cases normally uses the land in somewhat exclusive ways. A sanctuary may provide the only place where a certain population carries out some part of its annual life cycle such as feeding, nesting, hauling out, or migration. In managing sanctuaries, other uses of the land are closely controlled, or are prohibited, in order to prevent changes in the habitat or disturbance of the protected species. Recreational access to state sanctuaries is controlled by permits issued by Division of Wildlife Conservation. Use of the wildlife itself is also closely controlled.

Use limitations

Any hardcopy or electronic products utilizing this data shall clearly indicate their source. If the user has modified the data in any way, they are obligated to describe the types of modifications they have performed. User specifically agrees not to misrepresent this data, nor to imply that the Alaska Department of Fish and Game approved the changes they made. This dataset was prepared to depict the boundaries of State of Alaska refuges, critical habitat areas and sanctuaries.

DATA QUALITY REPORT - COMPLETENESS OMISSION ►

MEASURE DESCRIPTION

This boundary layer is current as of July 1, 2008. The last change in boundaries was for Minto Flats State Game Refuge.

[Hide Data quality report - Completeness omission ▲](#)

DATA QUALITY REPORT - QUANTITATIVE ATTRIBUTE ACCURACY ►

MEASURE DESCRIPTION

Accuracy was tested by overlaying boundary arcs (interactively on screen) with Alaska Department of Natural Resources's Administrative Large Parcel Boundaries dataset and section grid layers, the National Hydrography Dataset flowline layer and comparing with legal descriptions in the Alaska State statutes. These boundaries are based on exact legal

descriptions and polygons based on the Administrative Large Parcels Dataset were automated by ADNR at a section level using aliquot parts. For those areas that contain tide and submerged lands please consult to the Alaska State Statutes to determine legal description within tide lands and marine waters.

[Hide Data quality report - Quantitative attribute accuracy ▲](#)

DATA QUALITY REPORT - ABSOLUTE EXTERNAL POSITIONAL ACCURACY ►
DIMENSION horizontal

MEASURE DESCRIPTION

Original polygon data were taken from ADNR's Large Parcel Administrative Boundaries layer. Boundaries were digitized for Cape Newenham State Game Refuge and Izembek State Game Refuge from legal descriptions in the Alaska State Statutes Title 16 Chapter 20. Digitized arcs were snapped to a statewide section grid digital layer provided by the Alaska Department of Natural Resources. Over time boundaries were revised as changes were legislated by the Alaska State government by digitizing using legal descriptions from the Alaska State Statutes.

PROCESS STEP ►

WHEN THE PROCESS OCCURRED 2014-11-21 00:00:00

DESCRIPTION

FWS WSFR TRACS team received zipped shapefiles from Alaska Dept of Fish and Game and upon unzipping the file, the shapefile was imported into a file geodatabase in order to run topology and generalize the data. Topology was created in ArcCatalog using the rules Must Not Overlap and Must Not Have Gaps. The topology errors were corrected in ArcMap.

The topologically corrected layer was generalized using the Simplify Polygon tool with the bend simplification and resolve topology error options. The generalized layer was exported to GCS WGS 84 and topology was recreated to confirm no additional errors were introduced.

Two double fields were added to the attribute table for the web mapper program: Area_sq_m and Len_m. Two integer fields were added to the attribute table for the web mapper program: IS_ACTIVE and IS_DELETED.

The layer was imported to the SDE Enterprise Oracle database using the SDO_GEOMETRY spatial type.
